

Project Design Phase
Proposed Solution Template

Date	30 September 2026
Team ID	
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Role-based ACLs open every record on a table to anyone who holds the role, so administrators cannot restrict access by the value of a field in the record.
2.	Idea / Solution description	A script-controlled ACL on a custom table. The script compares the value of a chosen field with the user's role and returns true or false. Separate ACLs are created for Read, Create, Write and Delete, and each is tested by impersonating users.
3.	Novelty / Uniqueness	Access follows the data itself, so one table can safely hold records for different groups. It uses only standard platform features and needs no plugin or extra licence.
4.	Social Impact / Customer Satisfaction	Sensitive records stay visible only to the people who should see them, and users still reach everything that belongs to them. Example: department managers see only their own department's records.
5.	Business Model (Revenue Model)	Example: the ACL set is packaged as a reusable update set that an implementation partner offers to ServiceNow customers as a fixed-price security hardening service, or that a company uses internally to avoid building a separate table per department.

6.	Scalability of the Solution	The same script pattern can be applied to other tables, fields and roles by changing the field name and role. Example: after the first table, the pattern is repeated for HR cases and finance requests.
