

Project Design Phase Solution Architecture

Date	30 September 2026
Team ID	
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

Figure 1: Architecture and data flow of the script-controlled ACL solution

How the data flows:

1. The administrator creates users, roles and the custom table on the ServiceNow instance.
2. A user opens a form or list through the Now Platform UI.
3. The security engine looks up the user's roles and runs the ACL for the operation (Read, Create, Write or Delete).
4. The ACL script compares the record's field value with the user's role and returns true or false.
5. The operation is allowed or denied, and the record is shown or hidden accordingly.
